A method of fabricating a dental restoration comprising providing a framework possessing a coefficient of thermal expansion of as high as about 18×10^{-6} /°C; and using a dental porcelain composition comprising a leucite crystallite phase dispersed in a feldspathic glass matrix to theamework to provide a smooth, non-abrasive surface thereon, wherein the fused dental porcelain composition having a maturing temperature in the range from about 750° to about 1050° C., a coefficient of thermal expansion (room temperature to 450° C.) of from about 12×10^{-6} /°C. to about 17.5×10^{-6} °C., and comprising:

Component	Amount (wt. %)
SiO ₂	57-66
Al ₂ O ₃	7-15
K ₂ O	7-15
Na ₂ O	7-12
Li ₂ O	0.5-3

and further comprising a dispersed leucite crystallite phase representing from about 5 to about 65 weight percent of the dental porcelain, and wherein the leucite crystallites possess diameters not exceeding about 10 microns.
